IN THE CLAIMS

1. (Original) A method of fabricating a cathode, comprising:
depositing a carbon material on a portion of a titanium substrate;
annealing the carbon material and the substrate in a heated atmosphere
at a reduced pressure to form an intermediate titanium carbide layer between the
deposited carbon material and the titanium substrate; and
removing remaining carbon material to expose the intermediate titanium
carbide surface as an active cathode material.
2. (Original) A method according to claim 1, further comprising the step of
post-processing the titanium carbide layer.
3. (Original) A method according to claim 1, wherein the depositing step is
performed by at least one of: an ink jet printing process, a thermal transfer
printing process, a hot stamping process, a dye sublimation process, a screen
printing process, a chemical vapor deposition process, a sputtering process, a
manually painting process.
4. (Original) A method according to claim 3, wherein the ink jet printing
process comprises a thermal ink jet printing process.
5. (Original) A method according to claim 3, wherein the ink jet printing
process comprises a piezoelectric ink jet printing process.
6. (Original) A method according to claim 3, wherein the ink jet printing
process comprises an acoustic ink jet printing process.
7. (Original) A method according to claim 1, wherein the carbon comprises
substantially pure graphite.

Applicant: Joachim Hossick-Schott
Serial No. 10/816,795
Page 3

8. (Original) A method according to claim 7, wherein the substantially pure graphite comprises a plurality of granules of graphite powder.
9. (Original) A method according to claim 1, wherein the removing step comprises a manual removal of the carbon.
10. (Original) A method according to claim 9, wherein the removing step comprises one of: abrading, rubbing, scraping, scuffing, chafing, filing, grating, brushing, polishing, wiping, or sanding.
11. (Original) A method according to claim 1, wherein the removing step comprises a machinery assisted removal step.
12. (Original) A method according to claim 1, wherein the machinery assisted step comprises one of: sanding, grinding, buffing, pneumatically-blasting with particulate material, polishing.
13. (Original) A method according to claim 1, wherein the titanium substrate comprises an interior portion of an electrochemical cell.
14. (Original) A method according to claim 13, wherein the electrochemical cell comprises a capacitor.
15. (Original) A method according to claim 14, wherein the capacitor comprises a tantalum anode spaced from the cathode and wherein the tantalum anode and the cathode are in fluid communication with an electrolyte.
16. (Original) A method according to claim 15, wherein the capacitor is disposed within a hermetically-sealed implantable medical device.

Applicant: Joachim Hossick-Schott
Serial No. 10/816,795
Page 4

17. (Original) A method according to claim 16, wherein the implantable medical device comprise an implantable cardioverter-defibrillator.
18. (Original) A method according to claim 1, wherein the titanium substrate comprises a substantially flat portion of titanium and at least a part of the surface of said portion is roughened.
19. (Original) A method according to claim 1, further comprising activating the titanium carbide layer.
20. (Original) A method according to claim 1, wherein the carbon material comprises a carbon nanotube material.
21. (Original) A method according to claim 20, wherein the carbon nanotube material comprises a single-walled carbon nanotube material.
22. (Original) A method according to claim 3, wherein the chemical vapor deposition process comprises a plasma-enhanced chemical vapor deposition process.
23. (Currently amended) A carbide cathode associated with an implantable medical device, consisting of:
a titanium substrate; and
a layer of titanium carbide disposed on a surface portion of said substrate,
the carbide formed from carbonaceous material.
24. (Original) A cathode according to claim 23, wherein the titanium substrate comprises a substantially flat sheet of titanium.

Applicant: Joachim Hossick-Schott
Serial No. 10/816,795
Page 5

25. (Original) A cathode according to claim 23, wherein the titanium substrate comprises an interior portion of a casing for a capacitor.

26. (Original) A cathode according to claim 25, wherein the capacitor further comprises:

- a valve metal anode spaced from the cathode;
- a porous separator material disposed between the valve metal anode and the cathode; and
- a liquid electrolyte in fluid communication with both the valve metal anode and the cathode.

27. (Original) A cathode according to claim 26, wherein the valve metal anode comprises a tantalum anode slug.

28. (Original) A cathode according to claim 27, wherein the capacitor is operatively coupled within an implantable medical device.

29. (Original) A cathode according to claim 28, wherein the implantable medical device comprises a cardioverter-defibrillator.

30. (Original) A cathode according to claim 29, further comprising a pair of capacitors operatively coupled within the cardioverter-defibrillator.

31. (New) A carbide cathode associated with an implantable medical device, consisting of:

- a titanium substrate; and
- a layer of titanium carbide disposed on a surface portion of said substrate, wherein the carbide formed from graphite.

Applicant: Joachim Hossick-Schott
Serial No. 10/816,795
Page 6

32. (New) A carbide cathode associated with an implantable medical device, consisting of:
- a titanium substrate; and
 - a layer of titanium carbide disposed on a surface portion of said substrate, the carbide formed from carbonaceous material,
 - wherein a portion of the carbonaceous material remains at the layer of the titanium carbide.
